```

```

In [6]: print('-----Reading for the Sodium Lamp-----')
sodium_data = data_dict['Sodium']
sodium_data

```

-----Reading for the Sodium Lamp-----

```

Out[6]:

```

	Linear Distance (cm)	Color	Order
0	13.94	Yellow(1)	1
1	13.98	Yellow(2)	1
2	29.23	Yellow(1)	2
3	29.25	Yellow(2)	2

```

In [7]: print('-----Linear Readings for Order 1 Bands of Hg-----')
display( data_dict['Linear-Order-1'] )

p = sodium_data['Linear Distance (cm)'].to_numpy()[:2]
q , slope_order1 = calibrate_interpolate(
    x = data_dict['Linear-Order-1']['Linear Distance (cm)'].to_numpy() ,
    y = data_dict['Linear-Order-1']['Wavelength (nm)'].to_numpy() , order
    linear=True , p = p
)

sodium_wavelength = np.append( sodium_wavelength , q )
q

```

-----Linear Readings for Order 1 Bands of Hg-----

	Linear Distance (cm)	Color	Wavelength (nm)
0	10.00	Violet[Deep]	404.7
1	11.54	Blue/Green	491.6
2	12.91	Green	546.1
3	13.72	Yellow-Orange(1)	577.0
4	13.78	Yellow-Orange(2)	579.1
5	14.69	Red(1)	623.4
6	14.76	Red(2)	690.8

Out[7]: array([586.88901099, 588.83626374])

```
In [8]: print('-----Linear Readings for Order 2 Bands of Hg-----')
display( data_dict['Linear-Order-2'] )

p = sodium_data['Linear Distance (cm)'].to_numpy()[2:]
q , slope_order2 = calibrate_interpolate(
    x = data_dict['Linear-Order-2']['Linear Distance (cm)'].to_numpy() ,
    y = data_dict['Linear-Order-2']['Wavelength (nm)'].to_numpy(), order
    linear = True , p = p
)

sodium_wavelength = np.append( sodium_wavelength , q )
q
```

-----Linear Readings for Order 2 Bands of Hg-----

	Linear Distance (cm)	Color	Wavelength (nm)
0	21.24	Violet[Deep]	404.7
1	21.38	Violet	407.8
2	24.17	Blue/Green	491.6
3	27.00	Green	546.1
4	28.60	Yellow-Orange(1)	577.0
5	28.72	Yellow-Orange(2)	579.1
6	30.60	Red(1)	623.4
7	30.91	Red(2)	690.8

```
Out[8]: array([591.11755319, 591.58882979])
```

since $(d\lambda/dx)_{\text{order}n} \propto 1/n$ we expect :

$$\zeta = \frac{(d\lambda/dx)_{\text{order}1}}{(d\lambda/dx)_{\text{order}2}} = \frac{2}{1}$$

```
In [9]: slope_order1/slope_order2
```

```
Out[9]: 2.011690000313097
```

we get $\zeta = 2.011690000313097$ which is highly accurate

```
In [10]: print('-----Angular Readings for Order 1 Bands of Hg-----')
          data_dict['Angular-Order-1']
```

```

slope_order1 = calibrate_interpolate(
    x = -data_dict['Angular-Order-1']['Angular Distance (*)'].to_numpy()
    y = data_dict['Angular-Order-1']['Wavelength (nm)'].to_numpy(), order
)

```

-----Angular Readings for Order 1 Bands of Hg-----

```

In [11]: print('-----Angular Readings for Order 2 Bands of Hg-----')
          data_dict['Angular-Order-2']

          slope_order2 = calibrate_interpolate(
              x = -data_dict['Angular-Order-2']['Angular Distance (*)'].to_numpy()
              y = data_dict['Angular-Order-2']['Wavelength (nm)'].to_numpy(), order
          )

```

-----Angular Readings for Order 2 Bands of Hg-----

here too $(d\lambda/d\theta)_{\text{order } n} \propto 1/n$ we expect :

$$\zeta = \frac{(d\lambda/d\theta)_{\text{order1}}}{(d\lambda/d\theta)_{\text{order2}}} = \frac{2}{1}$$

In [12]: `slope_order1/slope_order2`

Out[12]: 2.100839791337052

we get $\zeta = 0.7409141340876566$ which also is very accurate !

In [13]: `sodium_data['Calculated Wavelength (nm)'] = sodium_wavelength
sodium_data`

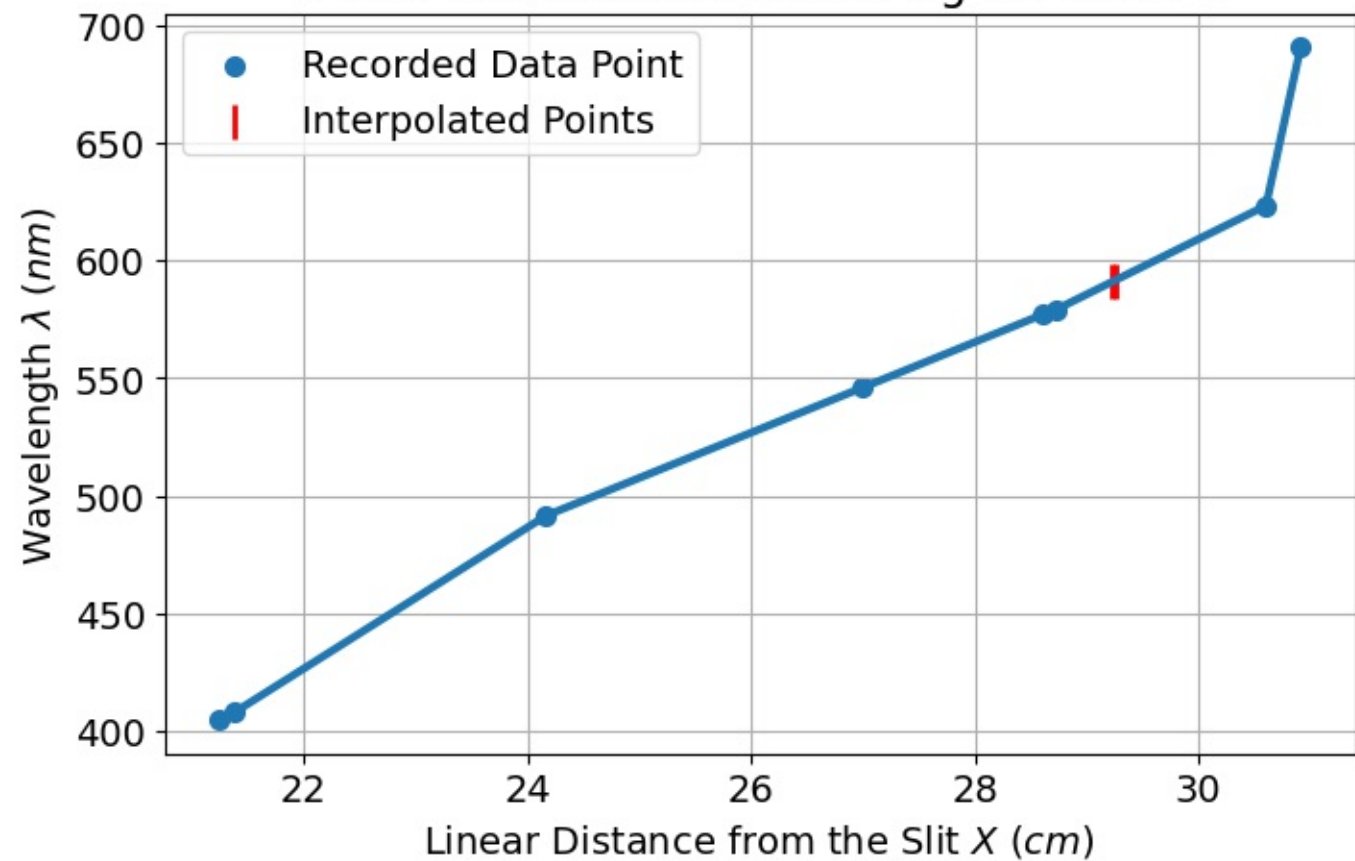

Out[13]:

	Linear Distance (cm)	Color	Order	Calculated Wavelength (nm)
0	13.94	Yellow(1)	1	586.889011
1	13.98	Yellow(2)	1	588.836264
2	29.23	Yellow(1)	2	591.117553
3	29.25	Yellow(2)	2	591.588830
